CookiesLast updated - May 24, 2020Q: How to check multiple conditions in a single line in Python? I know that I can do it in a single line as follows: if "column 2" in test\_dict: print "condition 1 met" elif "column 3" in test\_dict: print "condition 2 met" But I was wondering if it is possible to achieve the same in one line: A: Use a tuple in a list: if (("column 2",) in test\_dict): elif (("column 3",) in test\_dict): Test the data against the tuple. If the data exists, it will be included in the tuple and we can test it. However, it may be preferable

---

to use a dictionary here: if ("column 2" in test\_dict): elif ("column 3" in test\_dict): And if you want to get fancy, you could add it to the KeyError exception: def condition\_1(x): return "condition 1 met" def condition\_2(x): return "condition 2 met" try: if "column 2" in test\_dict: print condition\_1 elif "column 3" in test\_dict: print condition\_2
